

ORAL HEALTH CARE DURING PREGNANCY

Why is good oral health important during pregnancy?

- Maintaining good overall health during pregnancy will help to protect the baby from many health problems.
- Poor oral health in mothers can cause pain and infections, which can lead to taking too many medications.
- Untreated dental disease may result in poor nutrition and reduce the mother's ability to supply the growing baby with the nutrients needed for proper growth and development.

Hormonal Changes

- During pregnancy, a woman's body experiences hormonal changes. These changes can put pregnant women at an increased risk for developing oral diseases.
- During pregnancy, it is especially important to take good care of your teeth and gums.
 - ▶ Brushing teeth at least two times each day with a toothpaste that has fluoride.
 - ▶ Flossing at least once a day.

- Nausea and vomiting increase the amount of acid to which teeth are exposed. The acid wears away the surface of teeth.
- To help protect their teeth, pregnant women can do the following:
 - ▶ Rinse with a teaspoon of baking soda mixed with a cup of water.
 - ▶ Wait at least 30 minutes after vomiting before brushing.

- Pregnant women should ensure that they are drinking adequately fluoridated water.
- If fluoridated water is not available, pregnant women should discuss with a health professional about other ways that they can ensure they are receiving adequate amounts of fluoride.

- Pregnant women should receive a thorough dental examination during the first trimester to diagnose and prevent any oral diseases.
- The preferred time for any dental treatment needed is during the second trimester.
- If possible, some dental treatments may be postponed until after the baby is born.
